

Name - Nirosh Ravindran

Task - 3.2C

Student ID – BSCP|CS|63|134

1. Yes, the instance is in a public subnet. After the instance is created. If we select it and look under the networking option, in the subnet ID section, beside it in a bracket it is mentioned that it is a public subnet.
2. Yes, the instance has a IPv4 public IP address assigned to it. This is also found under the networking option for the instance, in the Public IPv4 address section, it will have a public IP address assigned to it.
3. Only TCP port 22 only are open for this instance. Select the instance, click the Security option and if we go below that we can see a section called inbound rules. In that we can see that in the protocol column it is mentioned as TCP and in the Port range column it is mentioned as 22. For now, this is the only port number used, but as we go deeper in this challenge, we will use port 80 as well.
4. No, this instance doesn't have an IAM role assigned. In the same security option, we can see the section called IAM role, where nothing has been assigned yet.
5. While creating the image, there will be as option called No Reboot and under that there is a checkbox called Enable. So, we have an option to not reboot, but by default it will be rebooted. If we don't want it to reboot, then we have to check the box under the No Reboot section.
6. Under the Instances volume, we can modify the size and there will be a check box called "delete on termination" which we can check or uncheck but the volume type or the other columns that are available cannot be modified.
7. Yes, under the Instances volume, there will be an option Add Volume, which will enable us to add more volumes to an AMI that we can create from an instance that only has one volume.

The grade for the challenge lab 4 is:
